Introduction

The codebook for ANAEROtest 23 is designed to identify bacteria using the MIKRO-LA-TEST ANAEROtest 23 test kit. The identification, ie interpretation of the result, can be done in three ways:

1. **manually** - by comparing the result with the data in the differentiation table
2. **using an identification program** (eg ErbaExpert)
3. **using this codebook**

All of the mentioned identification methods are based on the data of the identification matrix (frequency matrix, etc.), ie table containing taxa, tests and percentages of positive reactions of particular tests for each taxon. The taxon may be:

- genus - *Morganella sp*.
- species - *Morganella morganii*
- subspecies - *Morganella morganii ssp. morganii*

The codebook contains the identification results using the ANAEROtest 23 set ordered according to the value of the so-called profile code. Sorting results by the value of the profile code allows for easy and fast search. The identification quality evaluation for each profile code is based on the calculation of the probability of the result from the identification matrix data; the evaluation is detailed below.

Creating a profile code

For easier identification, it is advisable to convert the obtained results of each test (+/-) into a numerical profile (octal code). Tests are first divided into groups:

IND		GLU		MLT		FRU		GAL		LAC		MLZ		URE	
NIT	1	SUC	2	SAL	3	TRE	4	MAN	5	RHA	6	NAG	7	BGL	8
ESL		MNS		RAF		CEL		XYL		ARA		SOR			

Test groups are created in accordance with the test order in a vertical triples in the triplestrip.

The last group is incomplete and contains the remaining strip tests.

In each created group, there are assigned values 1, 2, and 4 to the particilar tests according to the following scheme:

IND	1	GLU	1	MLT	1	FRU	1	GAL	1	LAC	1	MLZ	1	URE	1
NIT	2	SUC	2	SAL	2	TRE	2	MAN	2	RHA	2	NAG	2	BGL	2
ESL	4	MNS	4	RAF	4	CEL	4	XYL	4	ARA	4	SOR	4		

When creating a profile code for a specific result, proceed as follows:

- positive tests are assigned 1, 2 or 4 values
- negative tests are always assigned a zero value
- the values assigned to the tests are added in each test group
- the resulting group of numbers represents the **profile code**

IND +	1	GLU +	1	MLT -	1	FRU +	1	GAL -	0	LAC -	0	MLZ -	0	URE +	1
NIT -	0	SUC +	2	SAL -	0	TRE +	2	MAN -	0	RHA +	2	NAG -	0	BGL +	0
ESL -	0	MNS +	4	RAF +	4	CEL -	0	XYL -	0	ARA -	0	SOR -	0		
1		**7**		**4**		**3**		**0**		**2**		**0**		**1**	

In this example, a profile **17430201** was created.

The results are organized in the codebook according to the value of the profile code in ascending order.

Using the codebook

The following information is provided for each profile code in the codebook:

- Profile code.
- Identification score and T-index values. They are listed for each taxon:

  Identification score – the taxon with the highest value is ranked first; the identification score indicates the probability of occurrence of a given result for that taxon, related to the probability of occurrence of the result for all other taxa.

  Identification score ≥ 99 … the strain is excellently distinguished
  Identification score ≥ 95 … the strain is very good distinguished
  Identification score ≥ 90 … the strain is distinguished
  Identification score < 90 … the strain is not sufficiently distinguished

  T-index – an indication of the extent to which the result corresponds to the most typical result for that taxon; an entirely typical result corresponds to a T-index value equal to 1. The value may lie in the range from 0 to 1 and is inversely proportional to the number of atypical tests.

  T-index ≥ 0,75 … typical strain
  T-index ≥ 0,50 … less typical strain
  T-index ≥ 0,25 … atypical strain
  T-index < 0,25 … completely atypical strain

- **List of atypical characters (tests)** - the list of all atypical characters (listed below) is valid only for the first taxon; the percentage of positive reactions is given for every atypical test.
- **List of additional tests** – if taxa are insufficiently differentiated, additional tests allow for more accurate identification. Additional tests show percentages of positive reactions.

If the profile code in the diagnostic list is not listed, it is a very atypical result, or it is a taxon that is not included in the identification matrix.
