CANDIDAtest 21

Erba Lachema s.r.o.

Erba® Mannheim

Introduction

The codebook for CANDIDAtest 21 is designed to identify bacteria using the MIKRO-LA-TEST CANDIDAtest 21 test kit. The identification, ie interpretation of the result, can be done in three ways:

1. **manually** - by comparing the result with the data in the differentiation table
2. **using an identification program** (eg ErbaExpert)
3. **using this codebook**

All of the mentioned identification methods are based on the data of the identification matrix (frequency matrix, etc.), ie table containing taxa, tests and percentages of positive reactions of particular tests for each taxon. The taxon may be:

- genus - *Morganella sp*.
- species - *Morganella morganii*
- subspecies - *Morganella morganii ssp. morganii*

The codebook contains the identification results using the CANDIDAtest 21 set ordered according to the value of the so-called profile code. Sorting results by the value of the profile code allows for easy and fast search. The identification quality evaluation for each profile code is based on the calculation of the probability of the result from the identification matrix data; the evaluation is detailed below.

Creating a profile code

For easier identification, it is advisable to convert the obtained results of each test (+/-) into a numerical profile (octal code). Tests are first divided into groups:

NGA		AGL		BGL		GEN		GLU		GAL		MAL	
AGA	1	PHE	2	URE	3	RHA	4	INO	5	TRE	6	LAC	7
PRO		PGU		MEL		XYL		CEL		SUC		RAF	

Test groups are created in accordance with the test order in a vertical triples in the triplestrip. Three tests are included in all groups.

In each created group, there are assigned values 1, 2, and 4 to the particilar tests according to the following scheme:

NGA	1	AGL	1	BGL	1	GEN	1	GLU	1	GAL	1	MAL	1
AGA	2	PHE	2	URE	2	RHA	2	INO	2	TRE	2	LAC	2
PRO	4	PGU	4	MEL	4	XYL	4	CEL	4	SUC	4	RAF	4

When creating a profile code for a specific result, proceed as follows:

- positive tests are assigned 1, 2 or 4 values
- negative tests are always assigned a zero value
- the values assigned to the tests are added in each test group
- the resulting group of numbers represents the **profile code**

NGA +	1	AGL +	1	BGL -	0	GEN +	1	GLU -	0	GAL +	1	MAL +	1
AGA -	0	PHE +	2	URE -	0	RHA +	2	INO -	0	TRE +	2	LAC -	0
PRO -	0	PGU +	4	MEL +	4	XYL -	0	CEL -	0	SUC +	4	RAF -	0
1		**7**		**4**		**3**		**0**		**7**		**1**	

In this example, a profile **1743071** was created.

The results are organized in the codebook according to the value of the profile code in ascending order.

Using the codebook

The following information is provided for each profile code in the codebook:

- Profile code.
- Identification score and T-index values. They are listed for each taxon:

  Identification score – the taxon with the highest value is ranked first; the identification score indicates the probability of occurrence of a given result for that taxon, related to the probability of occurrence of the result for all other taxa.

  Identification score ≥ 99 … the strain is excellently distinguished
  Identification score ≥ 95 … the strain is very good distinguished
  Identification score ≥ 90 … the strain is distinguished
  Identification score < 90 … the strain is not sufficiently distinguished

  T-index – an indication of the extent to which the result corresponds to the most typical result for that taxon; an entirely typical result corresponds to a T-index value equal to 1. The value may lie in the range from 0 to 1 and is inversely proportional to the number of atypical tests.

  T-index ≥ 0,75 … typical strain
  T-index ≥ 0,50 … less typical strain
  T-index ≥ 0,25 … atypical strain
  T-index < 0,25 … completely atypical strain

- **List of atypical characters (tests)** - the list of all atypical characters (listed below) is valid only for the first taxon; the percentage of positive reactions is given for every atypical test.
- **List of additional tests** – if taxa are insufficiently differentiated, additional tests allow for more accurate identification. Additional tests show percentages of positive reactions.

If the profile code in the diagnostic list is not listed, it is a very atypical result, or it is a taxon that is not included in the identification matrix.

List of taxa used to create a codebook

Candida africana
Candida albicans
Candida catenulata
Candida dubliniensis
Candida famata1
Candida famata2
Candida famata3
Candida famata4
Candida glabrata
Candida guilliermondii
Candida inconspicua
Candida intermedia
Candida kefyr
Candida krusei
Candida lambica
Candida lipolytica
Candida lusitaniae
Candida magnoliae
Candida membranifaciens
Candida norvegensis
Candida norvegica
Candida parapsilosis
Candida pelliculosa
Candida rugosa / pararugosa
Candida tropicalis
Candida utilis
Candida valida
Cryptococcus albidus
Cryptococcus humicola complex
Cryptococcus neoformans
Cryptococcus terreus
Geotrichum candidum
Geotrichum capitatum
Rhodotorula glutinis
Rhodotorula mucilaginosa
Saccharomyces cerevisiae TRE-
Saccharomyces cerevisiae TRE+
Trichosporon sp.
Trichosporon sp. RAF- MEL-

List of tests used to create a codebook

Basic set of tests

NGA N-acetyl-b-D-galactosaminidase
AGA alpha-galactosidase
PRO L-prolinaminopeptidase
AGL alpha-glucosidase
PHE L-phenylalanine-aminopeptidase
PGU p-nitrophenyl-alpha-glucuronidase
BGL beta-glucosidase
URE urease
MEL melibiose assimilation
GEN acid from gentiobiose
RHA rhamnose assimilation
XYL xylose assimilation (ASS)
GLU acid from D-glucose
INO myo-inositole assimilation
CEL cellobiose assimilation
GAL acid from galactose
TRE trehalose assimilation
SUC saccharose assimilation (ASS)
MAL acid from maltose
LAC lactose assimiliation (ASS)
RAF raffinose assimilation

Additional (distinguishing) tests

ATS arthrospores production
GET germ tubes production
HYP hyphes production
PSH pseudohyphes production

Введение

- Кодовая книга для КАНДИДАтест 21 предназначена для идентификации грибов с использованием тестового набора MIKRO-LA-TEST КАНДИДАтест 21. Идентификация, т.е. интерпретация результата, может быть выполнена тремя способами:
- 1. вручную - путем сравнения результата с данными в таблице дифференцирования
- 2. с использованием программы идентификации (например, ErbaExpert)
- 3. используя эту кодовую книгу
- Все упомянутые методы идентификации основаны на данных матрицы идентификации (частотной матрицы), то есть таблицы, содержащей таксоны, тесты и проценты положительных реакций конкретных тестов для каждого таксона. Таксоном может быть:
- род - *Morganella sp*.
- вид - *Morganella morganii*
- подвид - *Morganella morganii ssp. Morganii*

Кодовая книга содержит результаты идентификации с использованием набора КАНДИДАтест 21, упорядоченного в соответствии со значением так называемых кодов профиля. Сортировка результатов по значению кода профиля позволяет легко и быстро искать. Оценка качества идентификации для каждого кода профиля основана на вычислении вероятности результата из данных матрицы идентификации; оценка приведена ниже.

Создание кода профиля:

Для более точной идентификации целесообразно преобразовать полученные результаты каждого теста (+/-) в числовой профиль (восьмеричный код). Тесты сначала делятся на группы:

NGA		AGL		BGL		GEN		GLU		GAL		MAL	
AGA	1	PHE	2	URE	3	RHA	4	INO	5	TRE	6	LAC	7
PRO		PGU		MEL		XYL		CEL		SUC		RAF	

Теперь получаем 6 групп по три. В каждой группе только каждому положительному тесту даются числовые значения 1, 2 и 4:

первый тест тройки - 1
второй тест тройки - 2
третий тест тройки - 4
всем отрицательным результатам дается значение 0

NGA	1	AGL	1	BGL	1	GEN	1	GLU	1	GAL	1	MAL	1
AGA	2	PHE	2	URE	2	RHA	2	INO	2	TRE	2	LAC	2
PRO	4	PGU	4	MEL	4	XYL	4	CEL	4	SUC	4	RAF	4

При создании кода профиля для конкретного результата необходимо выполнить следующие действия:

• положительным испытаниям присваиваются 1, 2 или 4 значения
• отрицательным испытаниям всегда присваивается нулевое значение
• полученные значения суммируются в каждой тестовой группе
• итоговая группа чисел представляет собой **код профиля**

NGA +	1	AGL +	1	BGL -	0	GEN +	1	GLU -	0	GAL +	1	MAL +	1
AGA -	0	PHE +	2	URE -	0	RHA +	2	INO -	0	TRE +	2	LAC -	0
PRO -	0	PGU +	4	MEL +	4	XYL -	0	CEL -	0	SUC +	4	RAF -	0
1		**7**		**4**		**3**		**0**		**7**		**1**	

В этом примере был создан профиль **1743071**.
Результаты располагаются в кодовой книге в соответствии со значением кода профиля в порядке возрастания.

ИСПОЛЬЗОВАНИЕ ИНДЕКСА ЧИСЛОВЫХ ПРОФИЛЕЙ

Найдите числовой профиль в индексе; профили систематизированы в регистре в порядке возрастания величин чисел.
Профиль сопровождается следующей информацией:

- значения 2-х индексов для каждого таксона:
  а) процент идентификации (% id) – показатель, оценивающий насколько близко полученный профиль соответствует идентифицированному таксону по сравнению с другими таксонами, включенными в банк данных;
  таксоны систематизированы в соответствии с их величинами % id.
  б) Т индекс (Tin) – показывает насколько близко профиль соответствует большинству типичных реакций данного таксона. Его величина варьирует от 0 до 1 и обратно пропорциональна количеству атипичных тестов.
- перечень атипичных тестов (T. against) для первого из перечисленных таксонов с указанием процента положительных реакций, заложенных в базу данных;
- перечень дополнительных тестов – если таксоны не достаточно хорошо идентифицируются с помощью КАНДИДАтест 21; дополнительные тесты
  приводятся с процентом положительных реакций, заложенных в базу данных;
- пояснения в случае, если качество идентификации выходит за рамки вышеперечисленных показателей;
- оценка качества идентификации, исходя из значений %id и T-index:

Процент идентификации
%id >= 99 – таксон отлично отличается от других таксонов
%id >= 95 - таксон очень хорошо отличается от других таксонов
%id >= 90 - таксон удовлетворительно отличается от других таксонов
%id < 90 - таксон неудовлетворительно отличается от других таксонов

Т-индекс
Т-индекс >= 0.75- типичный штамм
Т-индекс >= 0.50- менее типичный штамм
Т-индекс >= 0.25- атипичный штамм
Т-индекс < 0.25- полностью атипичный штамм

Т-индекс	**%id**	**качество идентификации**
>= 0.75	>= 0.99	ОТЛИЧНАЯ ИДЕНТИФИКАЦИЯ
>= 0.50	>= 0.95	ОЧЕНЬ ХОРОШАЯ ИДЕНТИФИКАЦИЯ
>= 0.25	>= 0.90	ХОРОШАЯ ИДЕНТИФИКАЦИЯ для первого таксона
>= 0	>= 0.90	ПРИЕМЛИМАЯ ИДЕНТИФИКАЦИЯ для первого таксона
	< 0.90	НИЗКОЕ РАЗЛИЧИЕ - выбранные таксоны относятся к разным родам ИДЕНТИФИКАЦИЯ ДО РОДА - выбраны более одного таксона того же рода ИДЕНТИФИКАЦИЯ ДО ВИДА - выбраны более чем один вид и подвид в одном образце

В случае, если профиль не найден в индексе профилей, то возможно:

- профиль является совсем атипичным и частота его встречаемости очень низкая
- профиль относится к таксону, который не включен в базу данных.

Список таксонов, используемых для создания кодовой книги

Candida africana
Candida albicans
Candida catenulata
Candida dubliniensis
